

# under OVER

is a multiband guitar booster that can be used for many different purposes. Like most guitar boosters it can boost your guitar signal when it's time for a solo or if you want to push your amp into overdrive. It's also great between your guitar and your overdrive or distortion pedal. Our FETTO pedals loves to push, and to be pushed by, the Under Over!

But Under Over can do more than that. The "Under" control will add just the amount of fatness that you need. Or if your sound has too much low end then just turn the control down to clean up. With the "Over" control you control the midrange. Turn it down to get that scooped hard rock or heavy metal sound. Or if you are lost in the band mix, then turning it up might be a good idea. Finally the "& Out" knob will handle your shimmering 0 to +30 dB signals!
